

## ABSTRACT

A keyboard for displaying host operating conditions displays operating information such as temperature of CPU and hard disk drives and rotation speed of radiator fan and provides control. A display device and a rotation speed regulator are located on the operation side of the keyboard that faces and is visible to users. The keyboard contains a display micro-control unit to actuate the display device. The information of the temperature of CPU and hard disk drives and the rotation speed of radiator fan detected by the host are directly displayed on the visible location of the keyboard so that users can directly read the temperature of CPU and hard disk drives and rotation speed of radiator fan from the operation side of the keyboard, and control the rotation speed of the radiator fan through the rotation speed regulator. Operation and monitoring is much easier.
